# Tracking

T Q R TRAVELLER

Tracking made easy

There are many tracking and production management tools on the market today. TQR Traveller targets the small to medium size shops, directly to the needs of a production supervisor who would like to manage the work with a few mouseclicks.

As soon the goods are assigned to the system, the software keeps track of every production step. At every Barcode or RFID station, the Traveller can be scanned and the terminal tells the software the location and grade of manufacturing. On TQR controlled machines the software even automatically loads the correct article.

Configured and installed in a short time, the TQR Traveller software is a cost effective tool that fits into most plating shops. And even then, when the job is done, TQR Traveller offers features how to print out the delivery note and inform the customer with an email that his work is ready and will arrive shortly - or why not inform the secretary to send the invoice at the same time?
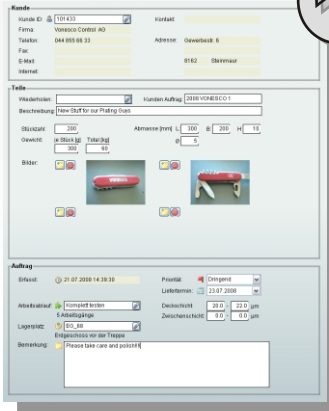

Feature overview

- Processing steps
- Customer database
- Storage places
- Processing sequence
- User management
- Capacity of machines
- Overview of incoming work

3 Steps to create, release and track
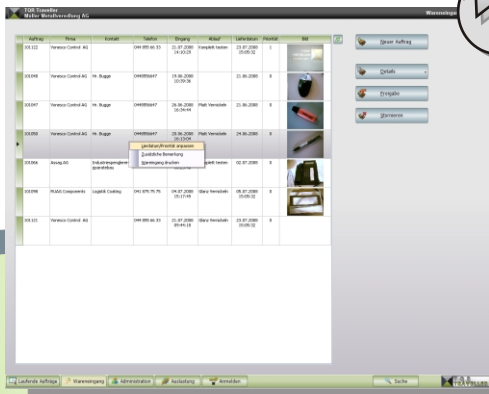

1 Assign

Assign the job to the system. As soon the customer is selected, the system displays previously done jobs, or allows to create a new one. Customer numbers, job numbers, work sequence, dimensions, surface and much more can be defined and if you like, use any common webcam to take a snapshot of the product. Add shipping date, priority, write some comments and hit OK.

Your job is now assigned in the system and waits for the release by the production supervisor.

2 Release

The job sits in the queue, sorted by shipping date and waits to be released. The production supervisor can now edit and change the complete job, and change priorities. When ready, acknowledge the production steps and release the job for production.

Ready!

3 Track

The job is now in production and cannot be modified anymore. Once the Traveller is scanned at a production step station, the software changes the status of the manufacturing process. When all steps are done, the Supervisor can end it and print out the delivery note and send an email to the customer.

Whatever will be done at the end, the software is custom made for every application.
